

## APPENDIX

### 1

EP-1 041 025 A is commented on in the application text,  
p. 3, ll. 1-9.

In DE-42 33 521 A1 an adhesive tape is described with an  
inner adhesive surface and an outer adhesive surface which  
5 consists of two parallel strips separated by a gap. After  
lifting of a section of the web adjacent to its end the  
inner adhesive surface of the tape is pressed against the  
next-inner layer of the reel. Then the web section is  
returned to its original position and a strip immediately  
10 adjacent to the web end pressed against one of the adhesive  
strips constituting the outer adhesive surface while the  
other strip remains free.
